Introduction to Machine Learning

Machine Learning is a branch of Artificial Intelligence that allows computers to learn patterns from data and make predictions or decisions.

Supervised Learning

Supervised learning uses labelled data to train a model. Examples include predicting house prices and classifying emails as spam or not spam.

Unsupervised Learning

Unsupervised learning uses unlabelled data to discover patterns or groups. Clustering is a common example.

Training Data

Training data is used to teach a machine learning model. The model learns patterns from the training data and uses those patterns to make predictions on new data.

Generative AI

Generative AI can create new content such as text, code, images, and other types of media based on patterns learned from data.
